

NGUYEN THE BAO

Backend Developer Intern

DOB: Dec 23, 2005
Phone: 0349554353
Email: baontph51745@gmail.com
Address: Hanoi, Vietnam
GitHub: github.com/ngt-baor
Portfolio: thebao.vercel.app

OBJECTIVE

- Highly motivated IT student seeking a Backend Developer Intern position to gain practical experience and enhance technical skills.
- Passionate about backend architecture and database management, with a long-term goal of becoming a Solution Architect.

EDUCATION

2023 - 2026 (Final Year Student)	FPT Polytechnic College - Hanoi Major: Software Development Core Coursework: Java Programming, Database Management (SQL Server), Web Development (Java/JSP), Agile Project Management, Software Testing.
-------------------------------------	---

SKILLS

- Languages & Platforms: Java, SQL, HTML, CSS, JavaScript
- Frameworks/Libraries: Spring Boot, Spring Data JPA, Hibernate, Servlet, JSP, Jakarta EE, Tomcat
- Databases & Deployment: SQL Server, MySQL, PostgreSQL, Docker
- Other: REST APIs
- Tools: GitHub, Postman, IntelliJ IDEA, VS Code

PROJECTS

May 2026 - Jul 2026	EzBook - Booking System Role: Java Web Developer GitHub: github.com/ngt-baor/EzBook Demo: ezbook-dz8b.onrender.com - Built a booking/operations system for salons and spas using Java Servlet/JSP (Jakarta EE), JDK 17, Tomcat 10, with a clean controller - repository - entity - filter architecture. - Implemented role-based access (ADMIN/STAFF/USER) via a custom Filter blocking unauthorized routes by path prefix. - Solved concurrent-login issue: each login issues a random session token (SecureRandom, 256-bit) stored in the DB; logging in elsewhere automatically invalidates the previous session. - Solved staff double-booking: checks for schedule conflicts before a booking is created. - Built registration/forgot-password/change-password flows using Gmail SMTP OTP (Jakarta Mail). - Migrated the database from SQL Server to PostgreSQL/Supabase and deployed via Docker on Render; added a /health endpoint paired with a GitHub Actions ping every 14 minutes to prevent the free-tier instance from sleeping. - Prefetches role-based pages right after login to reduce perceived load time; all queries use PreparedStatement to prevent SQL injection.
Oct 2024 - Aug 2025	Certain Shop - E-commerce Platform Role: Full-stack Developer GitHub: github.com/ngt-baor/Certain-Shop - Built a full-stack e-commerce platform for clothing retail: Spring Boot 3/Java 17 backend with a layered controller - service - repository architecture, React 19/TypeScript/Vite frontend, SQL Server database. - Implemented JWT authentication via Spring Security; built a custom Rate Limit Filter to block IP-based brute-force attempts on login and public endpoints. - Mitigated IDOR risk: built a current-user utility layer so APIs always verify data ownership against the authenticated user instead of trusting client-supplied IDs. - Built the cart-to-order flow with full order status history tracking, voucher application, and VNPay payment integration. - Integrated the GHN (Giao Hang Nhanh) shipping API: fetched province/district/ward lists and calculated real shipping fees by weight and destination. - Managed product variants by color/size/material with per-variant images; built an admin dashboard for daily revenue, best-sellers, and low/out-of-stock alerts. - Built an in-store POS flow for staff: create invoice, search/add products, apply/remove vouchers, checkout, cancel, and print PDF invoices. - Wrote unit tests for 5 core services (orders, cart, users, products, vouchers) and the rate limiter.
